# 1 Safety instructions

### 1.1 Safety regulations

All work must be performed by trained mechanics at qualified service centres and authorised specialist
companies who have access to all relevant tools and have acquired the know-how required for this work.
Anyone who performs maintenance and repair work must be trained in automotive mechanics and already have
experience in repairing drawbar trailers and semi-trailers.

- · Comply with local safety regulations.
- The relevant operating and service instructions and the safety instructions of the vehicle manufacturer or of the other vehicle component manufacturers must be followed.
- The vehicle must be prevented from moving during repair work. Please observe the relevant safety regulations for repair work on commercial vehicles, in particular the safety regulations for jacking up and securing the vehicle.
- Do not perform repair work unless wearing protective clothing (gloves, safety boots, safety goggles, etc.) and using the recommended tools.
- Use only recommended tools.
- All air lines and components must be depressurised before opening.
- All exchanged components must be reused or disposed of in accordance with the applicable environmental regulations, laws and directives.
- Tighten screws and nuts to the prescribed tightening torque.
- The tyre valve must be positioned far enough away from the brake caliper to prevent it and the tyre from becoming damaged.
- Damaged or missing components must be replaced immediately
- The components of the BPW AirSave must not be painted.
- The BPW AirSave hub cap adapter must not be disassembled.
- Make sure that the vent openings are not blocked. Prevent vent openings from becoming blocked to allow system air to escape from the wheel end. Serious personal injury and property damage can result.
- Test the tyre filling system for air leaks before using the vehicle for the first time. Spray a corrosion-free leak-detection solution on all links and connections (this can be soapy water). Listen for audible leaks and check for bubbles. If you discover a leak, identify the source and replace any parts as needed. Air leaks in tyre filling system can cause damage to components during operation.
- Do not overtighten the valve hoses. This could damage the hose seal and cause the tyre to lose air when the drawbar trailer is parked. Component damage can result.
- Before carrying out various activities on the system, the shut-off nozzle must be closed and air vented via the
  excess pressure valve on the AirSave Control Box.
- A minimum outlet pressure of 6.0 bar is required to ensure faultless function of the BPW AirSave.
   The working range is between min. 6.0 and 11.2 bar. An incorrectly set pressure can lead to increased tyre wear and fuel consumption, and in the worst case to a tyre failure. A pressure of 9.2 bar is preset on the AirSave Control Box.
- There must be a minimum distance of 5 cm between the rubber vents and the drawbar trailer chassis. The rubber vents must not be compressed.
- A round cable with a cross-section of 6 10 mm must be used for the cabling.
   The ADR Directives must be observed for cabling.
- All lines must be laid in the protected area and be protected from damage, kinking or chafing. All threads must be free from impurities, greases and oils. Adequate clearance must be ensured as the axle extends and compresses.
- First assemble the hub cap and then the rotor. Assembling the two components at the same time can cause untightness of the O-rings.
- Valve hoses are not allowed to be kinked, cover wheel nuts or protrude over the rim.
   A damaged valve hose can cause the tyre to deflate completely.
- Make sure that you only use the AirSave rotor from BPW (grey cap & white PTFE sealing ring), as this is the only
  way to ensure tightness.
- When fitting the rotor, hold the hub cap adapter to make sure that the rotor is screwed in as far as it will go. The valve connection is aligned afterwards by rotating the hub cap adapter (SW 55).

# Safety instructions

#### Safety instructions 1.2

These installation instructions contains different types of safety instructions, each of which is marked by an icon and a signal word. The signal word describes the severity of the potential danger.

Warning! **Possible** potential danger of serious or fatal injury (severe injury or death).

Caution! **Possible** dangerous situation (minor injury or damage to property).

Repair note! Warning of damage to property or consequential damage if these instructions are

not observed.

Note! Application hints and especially useful information.

It is essential that maintenance is carried out in accordance with the prescribed intervals in order to maintain the safe operation and road safety of the vehicle.

Rectification of any defects which are discovered or replacement of worn parts should be carried out by a BPW Service Centre or BPW Direct Service Partner, unless the vehicle owner has the required specialist personnel, the required technical facilities and workshop manuals or possesses an official certificate to perform interim inspections or special brake inspections.

When installing spare parts, it is strongly recommended that only original BPW components are used. Parts authorised by BPW for trailer axles and axle units are regularly subjected to special inspections. BPW accepts product responsibility for such parts.

BPW is unable to determine whether all third party products can be used with BPW trailer axles and axle suspensions without any safety risk; this applies even if an authorised testing organisation has accepted the product.

The warranty becomes null and void if spare parts other than original BPW parts are used for warranty work.

# 2 System overview

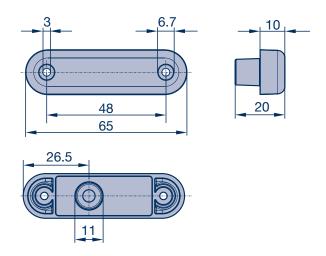

## 2.2 System components

#### **AirSave Control Box**

Drill template for the assembly of the AirSave Control Box - see page

#### BPW LED light for assembly on the vehicle chassis

# **System overview**

### Component descriptions 2.3

#### **AirSave Control Box**

The Control Box contains a twin-piston pump, a generator, a pressure relief valve, an excess pressure valve, a pressure regulating valve, a safety valve and a test connection.

The twin-piston pump increases the inlet pressure by a factor of 1.7 until the desired outlet pressure is reached.

The generator switches on the warning lamp whenever the system delivers an excessive air flow to an untight tyre or an untight tyre filling system component. The warning lamp flashes at different speeds, depending on the air flow.

The pressure relief valve ensures that air is available for other functions of the drawbar trailer. In addition, it retains the pressure in the air tank if a tyre or a tyre filling component becomes damaged.

The excess pressure valve is used to manually relieve the pressure from the tyre filling system. This allows maintenance to be carried out on the components of the drawbar trailer/semi-trailer axle or on the tyre filling system. In addition, the excess pressure valve opens automatically at a pressure greater than 11.2 bar.

The pressure regulating valve is used to set the system air pressure. The system air pressure should be adjusted to the tyre pressure recommended by the customer. The safety valve allows and stops the air supply to the system.

AirSave is a pneumatic system that operates autonomously and does not require a power supply.

An AirSave LED display assembled on the drawbar trailer/semi-trailer is switched on when the system pumps due to an untight tyre or an untight tyre filling system component.

#### Stator and rotor

The stator is located within the axle stub and the rotor is fastened to the wheel hub cap. Compressed air flows through a polyamid tube from the AirSave Control Box via a T-piece and through the inside of the axle to the rotating hub via a needle, which extends from the rotor into the stator.

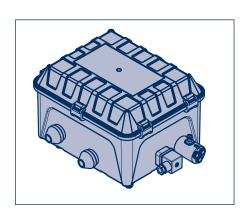

Seals located in the rotor and stator allow rotation without loss of compressed air. The rotor protective cap prevents impurities, such as dirt and water, from entering the wheel end.

# Stators Rotors

#### Valve hose

The tube is a flexible extension of the tyre valve. A check valve on the knurled end of the tube allows air to flow to the tyre in only one direction. This prevents each tyre from losing air pressure if the tyre filling system or a tyre deflates during operation.

# 3 Assembly

## 3.1 Assembling the hub cap and rotor

#### 3.1 Assembling the hub cap and rotor

During disassembly / assembly, the wheel can remain assembled on the wheel hub.

#### Version as of 08.2022 - original equipment

- [1] Remove the transport protection from the fitted hub cap.
- [2] Check the AirSave hub cap adapter (814) for damage and cracks.
- [3] Clean the face-side contact surface of the AirSave hub cap adapter.
- [4] Remove the plug from the hub cap adapter using a screwdriver (Phillips).Continue with work step [7], page 21.

- [1] Prevent the vehicle from rolling away.
- [2] Unscrew the hub cap (SW 110) from the wheel hub.
- [3] Remove the O-ring (459) from the wheel hub groove. (The O-ring is not required for axles with ECO Plus Unit).

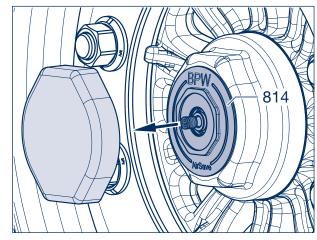

Figure 1

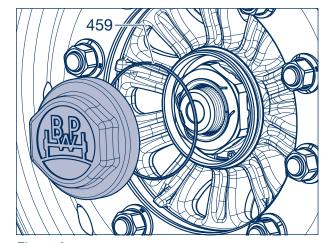

Figure 2

- [4] Insert a new O-ring (459) into the groove of the wheel hub (arrow). (The O-ring is not required for axles with ECO Plus Unit).
- [5] Cover the pre-assembled hub cap for BPW AirSave (814) in the area of the O-ring contact surface (for ECO Plus 3 only) and the thread with a thin coat of BPW special longlife grease ECO Li Plus.
- [6] Screw the hub cap onto the wheel hub and tighten to the prescribed tightening torque.

Tightening torques:

ECO Plus 3 hub cap SW 110 350 Nm ECO Plus hub cap SW 110 800 Nm

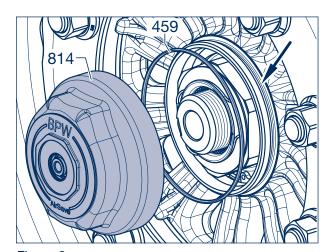

Figure 3

# Assembly 3

## Assembling the hub cap and rotor 3.1

- [7] Check soft sealing ring of the rotor (811 or 811a, depending on tyre) for correct seat at the end of the thread, push up to the bumper if necessary (Fig. 4, Section).
- [8] Guide the rotor into the adapter (817) of the hub cap and the stator (821) in the axle stub and push until contact is made. There will be a slight resistance.
- [9] Screw the rotor into the adapter and hand-tighten (approx. 5 Nm).

Installation and repair guide!
When fitting the rotor, hold the hub cap adapter (817) to make sure that the rotor is screwed in as far as it will go. The valve connection is aligned afterwards by rotating the hub cap adapter (SW 55).

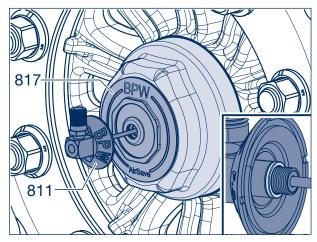

Figure 4

<u> AirSave on youtube</u>

Page 22 BPW-EA-AS 37882401e

# 3 Assembly

## 3.2 Hosing of axle stubs

#### 3.2 Hosing of axle stubs

- [1] Push the air pipe (832, polyamide tube, length 1350 mm) through the central bore hole of the axle stub.
- [2] Slide the air pipe into the stator (821) up to the bumper. Make sure that the pipe ends are cut off at right angles to the tube.
- The connecting lines from the axle lines to the control box are routed by the vehicle manufacturer in accordance with the vehicle conditions and are not included in the scope of supply of BPW Bergische Achsen KG.

  (Control box connections for the connecting lines  $\emptyset = 8 \times 1 \text{ mm}$ )

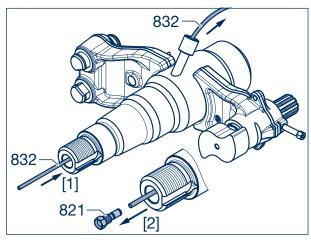

Figure 5

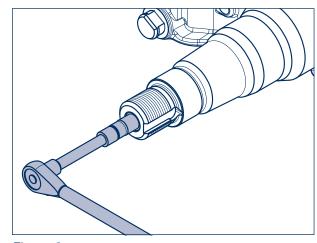

Figure 6

- [5] Push the anti-kink adapter (831b) onto the air pipe and screw it into the welded hose gland (arrow) on the stub axle. Hand-tighten with a spanner (SW 24) (5 Nm).
- [6] Push the spiral-shaped anti-kink device (831a) onto the air pipe and screw it by hand (5 Nm) onto the adapter that is already fitted (831b). This fixes the air pipe onto the axle beam and seals it.

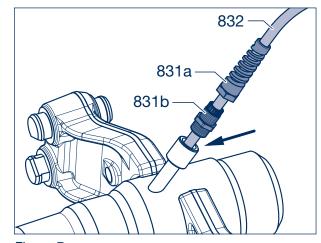

Figure 7

## Assembly

#### 3

## Assembling the valve hoses 3.3

#### 3.3 Assembling the valve hoses

Installation and repair guide!
When laying the valve hoses, make sure they do not become kinked.
Wheel nuts must not be covered!
Contact with wheel nuts or wheel studs must be avoided to prevent chafe marks.

- [1] Attach valve hose (825, 826 or 827, depending on tyre) to the tyre valve, use a valve extension if necessary.
- [2] Hand-tighten the union nut (SW 11) on the valve hose and then tighten a further half-turn using a spanner.
- [3] Check that the air can penetrate by pushing the valve needle in the valve hose.
- [4] Turn the hub cap adapter (817) using a spanner (SW 55) or spring pliers until the screwed joint of the rotor can be connected to the valve hose (see Figure 9).

#### Do not turn back the rotor!!

- [5] Hand-tighten the valve hose on the AirSave rotor (811 or 811a).
- [6] Check valve hose for untightness.

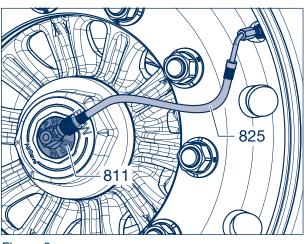

Figure 8

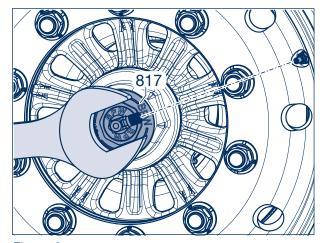

Figure 9

Installation and repair guide!
The valve hose must not be pointing in the screw-off direction of the AirSave rotor, see Figure 10.

AirSave on youtube

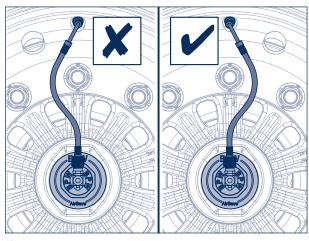

Figure 10

Page 24 BPW-EA-AS 37882401e

# 3 Assembly

## 3.4 Assembling the valve hoses

#### 3.4 Assembling the AirSave Control Box

Installation and repair guide!
When drilling the fastening holes, pay attention to power and pneumatic lines and to supporting parts.

To connect to the vehicle cabling, use only round cables with a cross-section  $\emptyset$  6 – 10 mm to guarantee the sealing of the PG11 screwed joint.

The AirSave Control Box should be assembled in a protected and easily accessible area in the vicinity of the pneumatic fittings.

The switch box cover plate must be removable for adjustment work and must not be locked.

There must be a clearance of min. 50 mm in front of the vent.

- [1] Hold the AirSave Control Box (842) in the required installation position.
- [2] Mark positions for the fixing holes.
- [3] Drill Ø 9 mm holes and deburr slightly.
- Drilling template see page 44.

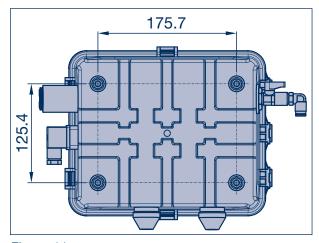

Figure 11

- [4] Insert the AirSave Control Box into the bore holes with the fixing screws.
- [5] Screw on the lock nuts (SW 13) with washers and tighten to a tightening torque of 25 Nm.

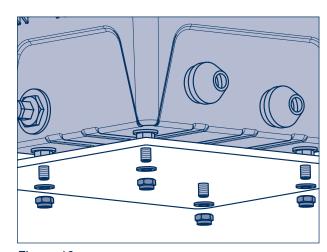

Figure 12

## **Assembly**

### 3

3.5

#### Assembling the AirSave LED display and adhesive label

# 3.5 Assembling the AirSave LED display and adhesive label

**Installation and repair guide!** 

The AirSave LED display must be visible to the driver in the rear-view mirror!

The connection lines to the AirSave Control Box must be laid such they are protected from damage and chafing.

- [1] Assemble the AirSave LED display (841) in the driver's rearward field of vision.
- [2] Drill the hole for the cable gland (Ø 11 mm) and for the fixing screws if necessary.
- Drilling template see page 45.
- [3] Lay connection lines to the Air Save Control Box (842) and connect according to the sketch.

#### **Function check:**

For the function check, remove the cover plate from the test connection (arrow) and vent some air. When the installation or connection is correct the AirSave LED display starts to flash and the AirSave Control Box equalises the pressure. Finally assembly the cover plate.

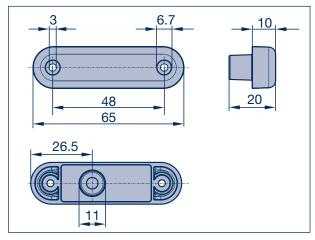

Figure 13

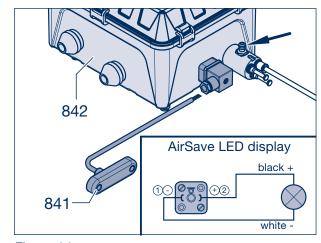

Figure 14

[4] Attach the adhesive label supplied in the vicinity of the AirSave LED display.

#### AirSave LED display flashes:

AirSave is working and equalising the pressure loss in the tyre. The journey must not be interrupted.

# AirSave LED display flashes for longer than 10 minutes:

The tyres, compressed air lines and connections must be checked.

#### AirSave LED display illuminates continuously:

AirSave can no longer equalise the pressure loss in the system or there is a malfunction.

A service centre must be sought immediately.

Figure 15

Page 26 BPW-EA-AS 37882401e

# 3 Assembly

## 3.6 Connection to the telematics TC Gateway

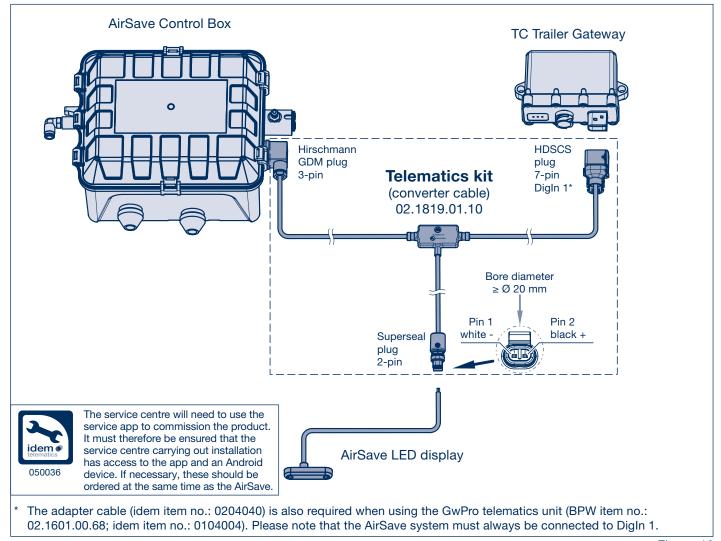

Figure 16

#### 3.6 Connecting to the telematics

In addition to the LED display on the vehicle, the AirSave system activities and pressure warnings can be recorded and transmitted via a telematics gateway from idem.

For this purpose, the telematics gateway is connected to the AirSave control box in accordance with the illustration above (Fig. 12) using the AirSave telematics kit (BPW Item no.: 02.1819.01.10).

The LED display is connected via a two-pin Superseal plug (BPW Item no.: 92.0000.1685). The plug must be assembled so that the white LED wire Pin 1 and the black LED wire Pin 2 match.

The AirSave telematics kit can be connected either to the TC Trailer Gateway itself or to the end of a gateway bus extension.

AirSave telematics kit KBA test number: E1\*10R05/01\*8949\*00

For all matters relating to idem TC Trailer Gateway products, the idem telematics GmbH technical support team is available from Monday - Friday between 08:00 and 18:00 CET.

Phone: +49 (0) 89 720 13 67 - 10 Email: support@idemtelematics.com

Before contacting the support team, please be sure to have the relevant product and vehicle data to hand.

## Assembly

### Assembling the pressure lines 3.7

#### 3.7 Assembling the pressure lines

#### 3.7.1 Tubeless round axles Ø 146 as of 08.2022

- [1] Remove the plug (1, SW 14) from the axle tube.
- [2] Screw the AirSave angle piece (835, SW 22) into the axle beam.
- [3] Align the angle piece and tighten the integrated nut, incl. O-ring, to a specified tightening torque of **35 Nm** (30 40 Nm).

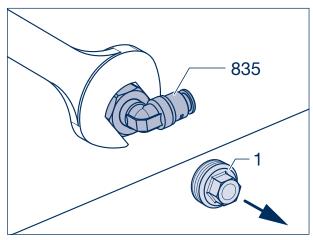

Figure 17

- [4] Cut off the air pipe Ø 8 x 1 mm at the end with a straight cut.
- [5] Push the air pipe into the AirSave angle piece (835) as far as it will go. You will feel resistance at two points. The insertion length is approx. 20 mm.

#### Installation and repair guide!

The air pipe is inserted far enough if two successive locking steps have been cleared and the line has been mounted to the bumper.

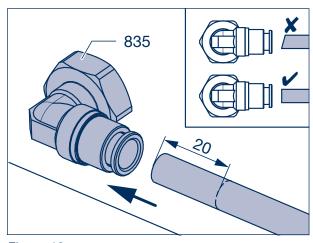

Figure 18

#### 3.7.2 Axles with tube system as of 08.2022

- [1] Remove the plug (840) from the angle piece (835). To do this, press the face-side ring into the angle piece while removing the plug.
- [2] Fit the air pipe, see chapter 3.7.1 work steps [4] and [5].

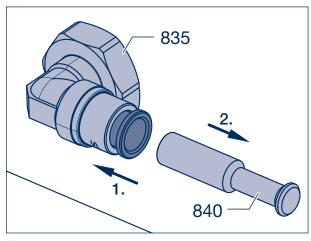

Figure 19

Page 28 BPW-EA-AS 37882401e

# 3 Assembly

## 3.7 Assembling the pressure lines

#### 3.7.3 Connecting to the Control Box

Installation and repair guide!
Before assembling the compressed air lines, the pneumatic circuit must be depressurised.

The pressure lines to the AirSave Control Box and the axles must be laid such that they are protected from damage and chafing.

The line position/length must be selected such that the lines are not damaged as the axle extends and compresses.

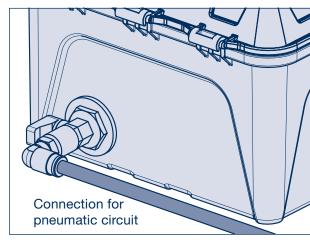

Figure 20

[1] For axles with air suspension, connect supply lines (Ø 8 x 1 mm PA line) to the AirSave Control Box (Figure 20) directly at the air tank of the trailer air suspension.

An inlet pressure of 6.0 bar is required to ensure that the Control Box is functioning correctly.

In the case of mechanical or hydraulic suspensions, the connection to the brake circuit must be made with an additional 6.0 bar pressure limit valve.

- [2] Insert reducers (839) into the pressure outlet on the Control Box.
  - As of 10/12/2020, the connection for the supply line on the AirSave T-piece (833) has been designed for a diameter of 8 mm. Reducers are not used in these versions!
- [3] Unoccupied compressed air outlets must be sealed using dummy plugs (840).
- [4] Remove dummy plugs (834, 840) from the AirSave T-piece (833).

#### **Axles with tube system**

[5] Insert the compressed air lines (Ø 8 x 1 mm) into the connection on the Control Box and connect to the AirSave T-piece on the axle. (On versions released up to 09/10/2020, compressed air lines (Ø 6 x 1 mm) and reducers (839) must be used at the Control Box connection.)

If the vehicle has other axles, a T-piece must also be integrated into the pneumatic circuit of each one, see Figure 21.

No more than 5 axles per Control Box are allowed to be connected. A second Control Box must be installed for 6 axles or more.

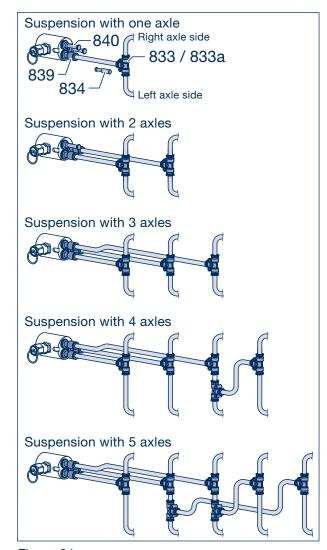

Figure 21

# Assembly

### 3

## Assembling the pressure lines 3.7

**(i)** 

#### Note:

As of 08.2022, the AirSave T-piece (833) for clamping will be replaced by a metal T-piece (833a) for screwing in place.

For assembly, the knurled nuts must be unscrewed and slid over the relevant air pipe.

Push the air pipe onto the AirSave T-piece as far as it will go (arrow) and screw hand-tight with the knurled nuts.

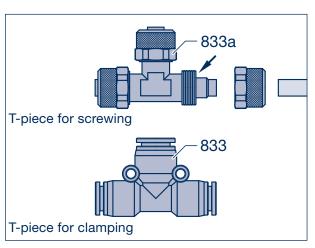

Figure 22

#### Tubeless round axles Ø 146

#### Note:

In the case of tubeless round axles as of 08.2022, only an angle piece (835) is used on the axle. The AirSave T-piece (833a) is required in order to connect a fourth or fifth axle and is to be fastened under the vehicle frame in a suitable location.

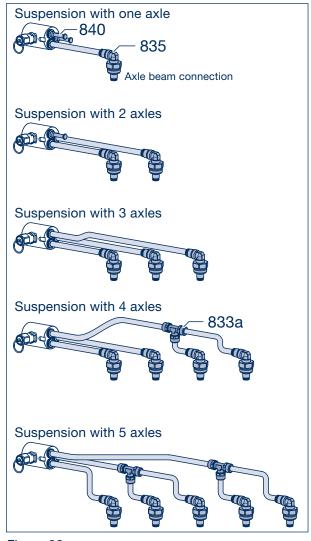

Figure 23

Page 30 BPW-EA-AS 37882401e

# 3 Assembly

## 3.7 Assembling the pressure lines

#### Steering axles N...LL / N...L

#### Note:

For steering axles from the N...LL / N...L series, an angle piece (835) is inserted into each steering pivot assembly on the axle. Due to the limited installation space in the vehicle, the centreline AirSave T-piece (the connecting piece for compressed air lines on the axle sides) is no longer required. The Ø 8 mm air pipes are connected to the AirSave T-piece (833a) on the vehicle frame and routed to the control box.

The axles are only equipped with AirSave up to the angled piece in the steering arm groups.

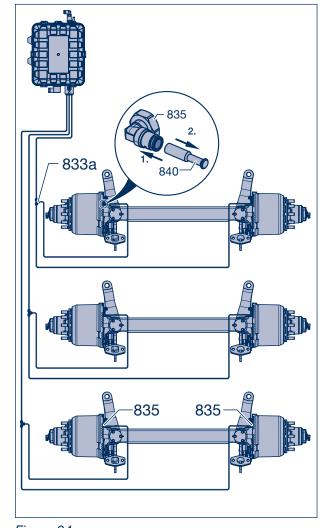

Figure 24

## Installation instructions

#### Installation in air-sprung axles:

The control box is connected to the air suspension storage tank. If there are several reservoirs, the replacement reservoir or the accessory reservoir is used.

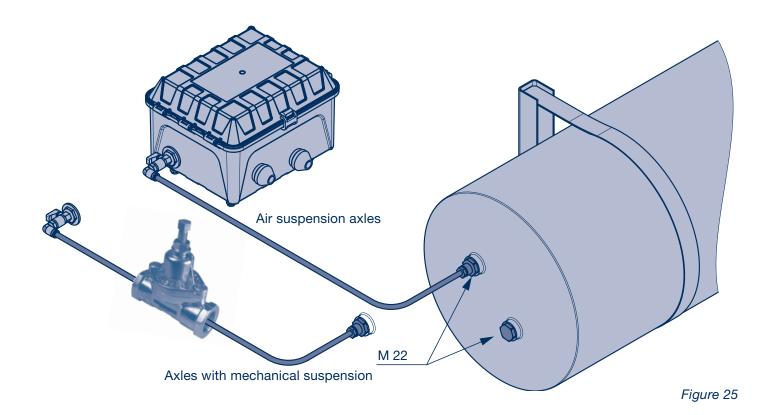

#### Installation in mechanically sprung axles:

It is permissible to connect the control box to the brake reservoir, if an additional pressure limit valve is connected between them. If there is an additional storage container, it is preferable to mount the control box onto this.

#### General

Air connections with an M22 thread are generally required for both the reservoir and the EBS valve.

The installation of a separate pressure relief valve is not absolutely necessary, as this is included in the control box.

Page 32 BPW-EA-AS 37882401e

# 5 Commissioning

## 5.1 Checking the control unit outlet pressure

Installation and repair guide!

Before commencing work on the system or on the wheel ends, always close the shut-off valve and relieve air on the excess pressure valve.

The outlet pressure must be 0.1 to 0.2 bar over the manufacturer's recommended tyre pressure in order to equalise the opening pressure of the downstream components.

- The outlet pressure is preset (see AirSave Control Box cover plate) and must be checked before commissioning.
- [1] Remove cap on the pressure connection (arrow, Figure 26).
- [2] Connect pressure gauge to the test connection (thread 8V1).(Attention, pressure gauge is not included in the scope of supply)!
- [3] Open shut-off valve on the AirSave Control Box (842).
- [4] Read off the pressure on the pressure gauge when the pumping process has ended.

**Installation and repair guide!** 

A minimum outlet pressure of 6.0 bar is required to ensure faultless function of the BPW AirSave.

The working range is between min. 6.0 and 11.2 bar. An incorrectly set pressure can lead to increased tyre wear and fuel consumption, and in the worst case to a tyre failure. A pressure of 9.2 bar is preset on the AirSave Control Box.

- [5] Remove pressure gauge.
- [6] Relieve pressure at the valve.
- [7] Wait for the AirSave Control Box pumping process and then reassemble the pressure gauge.
- [8] Repeat the test procedure twice.
- [9] Remove pressure gauge and screw the cap onto the valve.

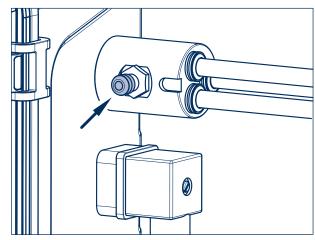

Figure 26

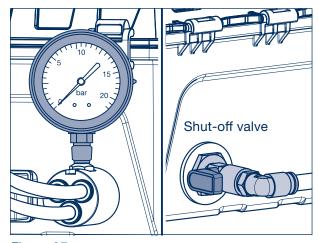

Figure 27

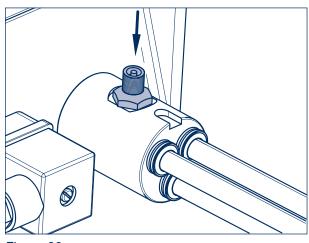

Figure 28

# Commissioning

## Adjusting the control unit outlet pressure 5.2

#### **Adjusting the outlet pressure**

- [1] Connect the pressure gauge as described in [1] and [2] and read off the pressure.
- [2] Remove pressure gauge and relieve air via the valve.
- [3] Wait for the pumping process, re-connect the pressure gauge and read-off the outlet pressure on the pressure gauge.

#### Repair note!

Before opening the AirSave Control Box, always close the shut-off valve and relieve the air on the excess pressure valve.

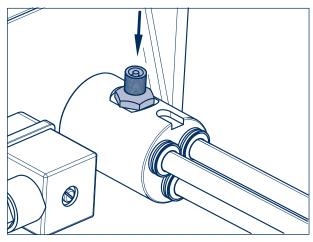

Figure 29

- [4] Detach the fixing tabs from the Control Box cover plate and open the cover plate.
- [5] Unlock the adjusting knob by pulling up and turning in small steps.
  - Increase the outlet pressure by turning clockwise
  - Reduce the outlet pressure by turning anticlockwise
- [6] Remove pressure gauge and relieve air via the valve.
- [7] Wait for the pumping process, re-connect the pressure gauge and read-off the outlet pressure on the pressure gauge.
- [8] Repeat the test procedure twice.
- [9] Push in the adjusting knob and then lock.
- [10] Place the cover plate on the Control Box and secure with the 4 fixing tabs.
- [11] Check the outlet pressure again and and re-adjust if required.

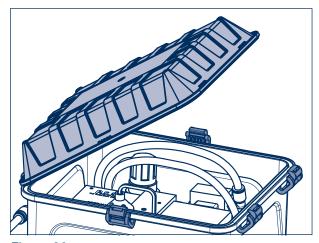

Figure 30

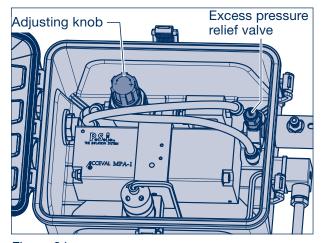

Figure 31

Page 34 BPW-EA-AS 37882401e

# 6 Maintenance intervals / Checks

	Commis- sioning	Before each journey	Annually	Every 3 years
Visual inspection				
Inspect all components for damage and untightness	Х	Х		
Check whether the shut-off valve on the AirSave Control Box is opened	X	X		
Check connection lines, valve hoses and rotors		X		
Check electrical and pneumatic lines			X	
Check the stator with filter element (RX axles) for dirt				Χ
Function checks				
Check outlet pressure on the AirSave Control Box (see chapter 5) and all tyres	Х		X <sup>1)</sup>	
Check AirSave LED display CMP5	X		Х	
Check rotor and BPW AirSave hub cap adapter for untightness	Х		Х	
Check connection lines for untightness	Х		Х	
Replace the rotor				X

<sup>1) 6</sup> months after installation, then annually

For heavy-duty applications, check more frequently (e.g. off-road, extreme weather conditions)

# Wheel change

#### Wheel disassembly

- [1] Detach valve hose (825, 826, 827, depending on tyre) from rotor (811 or 811a).
- [2] Detach valve hose from tyre valve.

#### Note:

For quicker and easier assembly, it is advisable to mark the position of the rim on the wheel hub and recreate this during assembly.

[3] Changing wheels.

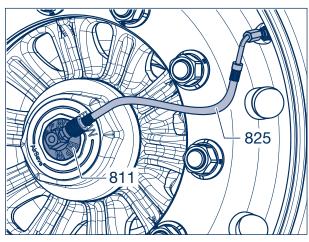

Figure 32

#### Wheel assembly

- [4] Turn the hub cap adapter (817) using a spanner (SW 55) or spring pliers until the screwed joint on the rotor is pointing towards the tyre valve (required only if the position of the rim on the wheel hub has changed).
- [5] Attach valve hose (825, 826 or 827, depending on tyre) to the tyre valve, use a valve extension if necessary.
- [6] Hand-tighten the union nut (SW 11) on the valve hose and then tighten a further half-turn using a spanner.
- [7] Check that the air can penetrate by pushing the valve needle in the valve hose.
- [8] Hand-tighten the valve hose on the AirSave rotor (811 or 811a).
- [9] Check the valve hose and the connections for untightness.

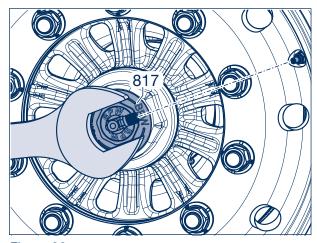

Figure 33

Page 36 BPW-EA-AS 37882401e

# 8 Repairs to the stator and internal tube

Installation and repair guide!
Before commencing work on the system or on the wheel ends, always close the shut-off valve and relieve air on the excess pressure valve.

- During disassembly / assembly, the wheel can remain assembled on the wheel hub.
- [1] Prevent the vehicle from rolling away.
- [2] Loosen valve hoses (825, 826, 827 depending on version) from the rotor (811 or 811a).
- [3] Screw rotor out of the AirSave hub cap adapter (817) and pull out.
- [4] Screw hub caps (819, SW 110) off the wheel hub.
- [5] Remove the O-ring (459) from the wheel hub groove. (The O-ring is not required for axles with ECO Plus Unit).

#### Axles with tube system up to 07.2022

- [6] Detach the polyamide tube (832) on the respective axle side from the AirSave T-piece (833).
- [7] Unscrew the kink protection (831b) with spiral (831a, SW 24) from the axle beam and remove via the polyamide tube. Make sure that the tube is not pulled out of the axle beam or off the stator. Continue with work step [9] on page 37.

Installation and repair guide!
Converting from the kink protection /
spiral version (831) to the angle piece (835) is permitted. The tube system in the axle beam must be retained or replaced if necessary.

#### Axles with tube system as of 08.2022

- [6] Press the face-side ring into the angle piece (835) and pull the air pipe Ø 8 mm out of the angle piece at the same time.
- [7] Unscrew the angle piece (SW 22) from the axle beam.
- [8] Press the face-side ring into the angle piece and pull out the polyamide tube (832, Ø 6 mm) at the same time. Make sure that the polyamide tube is not pressed into the axle beam.

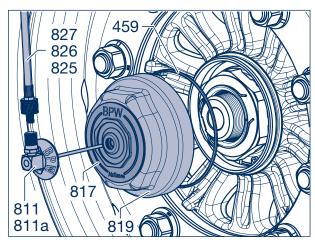

Figure 34

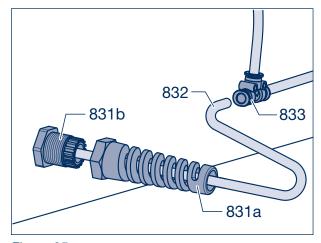

Figure 35

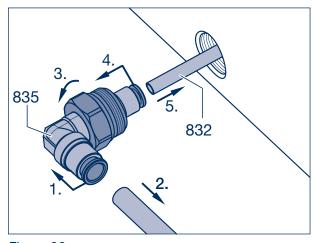

Figure 36

# Repairs to the stator and internal tube

[9] Use a tube connector to connect the new polyamide tube (832, Ø 6 mm) to the tube being replaced.

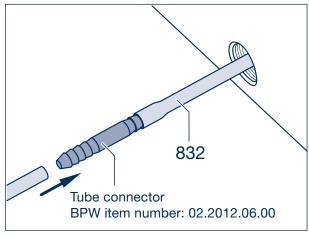

Figure 37

- [10] Unscrew stator (821) from the axle stub using a box spanner (SW 16).
- [11] The tube can now move freely in the axle beam and can be replaced if required.

#### Note:

When pulling out the polyamide tube, push the new tube a little way into the socket for the angle piece (835) on the axle beam.

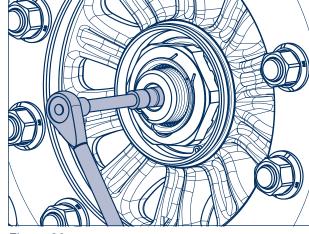

Figure 38

- [12] Press the face-side ring into the stator (821) and disconnect it from the old polyamide tube (832) at the same time.
- [13] Press the new polyamide tube all the way into the stator.
- [14] Apply a suitable liquid seal (e.g. Loctite 511 or Teflon tape) to the thread of the stator (arrow).
- [15] Screw the stator into the axle stub. Tightening torque: **40 Nm** (34 - 45 Nm)
- For axles with tube system up to 07.2022 and steering axles, see work step [16] on page 36.

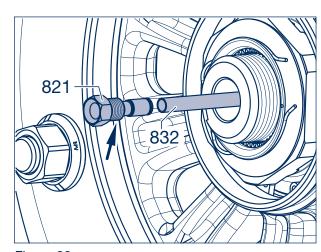

Figure 39

Page 38 BPW-EA-AS 37882401e

# 8 Repairs to the stator and internal tube

#### Axles with tube system as of 08.2022

- [16] Gently pull the polyamide line (832) taut at the axle beam hole.
- [17] Remove the tube connector.
- [18] Cut off the line with suitable tube pliers / scissors approx. 30 mm before the end with a straight cut and keep hold of it.
- [19] Push the polyamide line all the way into the straight connection of the angle piece (835).
- [20] Apply a suitable liquid seal (e.g. Loctite 511 or Teflon tape) to the thread of the elbow union (arrow).

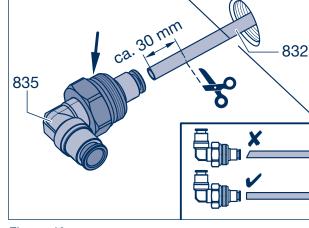

Figure 40

- [21] Screw the AirSave angle piece (835, SW 22) into the axle beam.
- [22] Align the angle piece and tighten the integrated nut, incl. O-ring, to a specified tightening torque of 35 Nm (30 40 Nm).

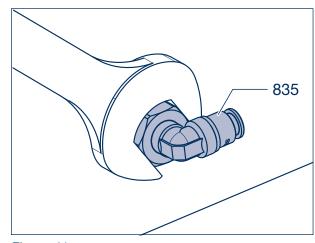

Figure 41

- [23] Cut off the air pipe  $\emptyset$  8 x 1 mm at the end with a straight cut.
- [24] Push the air pipe into the AirSave angle piece (835) as far as it will go. You will feel resistance at two points. The insertion length is approx. 20 mm.
- Continue with work step [25] on page 40.

#### Installation and repair guide!

The air pipe is inserted far enough if two successive locking steps have been cleared and the line has been mounted to the bumper.

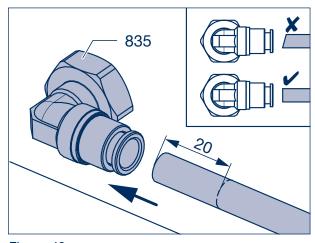

Figure 42

# Repairs to the stator and internal tube

#### Axles with tube system up to 07.2022

- [16] Fit the polyamide tube through the kink protection (831b) and the spiral (831a).
- [17] Screw the kink protection (SW 24) into the axle beam and tighten it hand-tight (5 Nm).
- [18] Screw the spiral-shaped kink protection (831a) by hand (5 Nm) onto the adapter that is already fitted (831b). This fixes the air pipe onto the axle beam and seals it.
- [19] Cut off the polyamide line Ø 6 x 1 mm at the end with a straight cut.
- [20] Push it all the way into the AirSave T-piece (833).
- Continue with work step [25] on page 40.

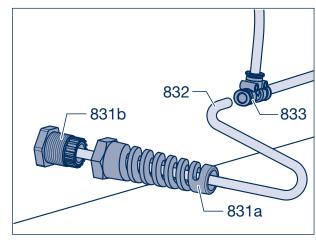

Figure 43

#### **Steering axles**

[16] Fit an anti-kink device (831) onto the camtube of the steering pivot assembly.

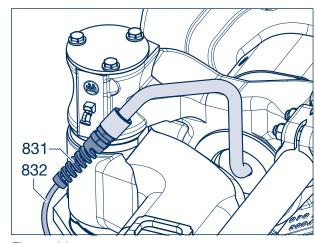

Figure 44

[17] Lay the tube (832) over the axle beam and fix it in place with a cable tie (849) offset approx. 150 mm from the spring centre in the direction of the centre of the axle.

#### Repair note!

After assembly, the steering must be checked for freedom of movement. If necessary, adjust the length of the tube between the camtube and the cable tie accordingly.

Sufficient clearance for the suspension components must be provided.

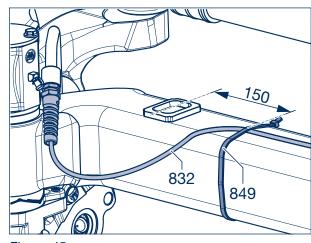

Figure 45

Page 40 BPW-EA-AS 37882401e

# 8 Repairs to the stator and internal tube

- [18] Fasten the AirSave T-piece (833) to the long cable tie (849) with a short cable tie (850).
- [19] Using the cable tie, fasten the pre-assembled T-piece to the axle beam near the shaped plate for the steering lock. The distance to the centre of the shaped plate should be approx. 100 mm.
- [20] Cut the valve tubes to length and connect them to the AirSave T-piece.
- Continue with work step [25].

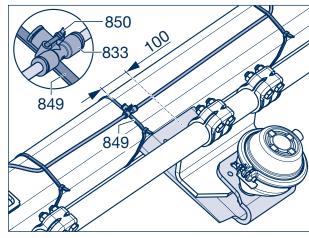

Figure 46

#### All axles with tube system

- [25] Insert a new O-ring (459) into the groove in the wheel hub. (The O-ring is not required for axles with ECO Plus Unit.)
- [26] Cover the pre-assembled hub cap for BPW AirSave (814) in the area of the O-ring contact surface (for ECO Plus 3 only) and the thread with a thin coat of BPW special longlife grease ECO Li<sup>Plus</sup>.
- [27] Screw the hub cap onto the wheel hub and tighten to the prescribed tightening torque.

Tightening torques:

ECO Plus 3 hub cap SW 110 350 Nm ECO Plus hub cap SW 110 800 Nm

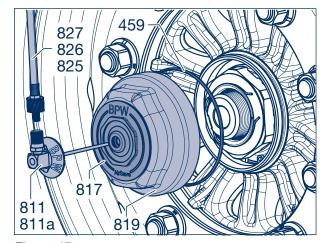

Figure 47

- [28] Check the white sealing ring of the rotor (811 or 811a, depending on tyre) for correct seating at the end of the thread; push up to the bumper if necessary.
- [29] Guide the rotor into the adapter (817) of the hub cap and the stator (821) in the axle stub and push until contact is made. There will be a slight resistance.
- [30] Screw the rotor into the adapter and hand-tighten (approx. 5 Nm).
- For the assembly process for the valve hoses (825, 826, 827 depending on version), see page 23.

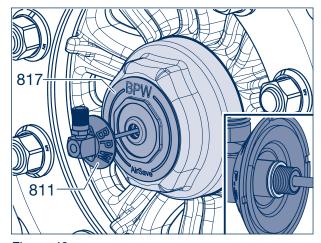

Figure 48

# Fault diagnostics

9

Condition	Possible causes	Measures
The AirSave LED display is switched on.	The system supplies air during commissioning.	The system works faultlessly.
	The system supplies air to an untight tyre.	Repair the tyre.
	The system supplies air to an untight system component.	Replace the system component.
	The system is not correctly connected to the hoses	Correct the hoses
The AirSave LED display is switched on and air escapes from the rotor.	The system supplies air to an untight system component.	Replace the system component.
	The rotor is untight.	Replace the rotor.
	The stator O-ring is untight.	Replace the stator.
	The thread of the lengthwise stator is not leak-proof	Seal the stator thread with Teflon tape (or similar) and screw it back in
The AirSave LED display is switched off during system	The AirSave LED display is out of operation.	Replace the AirSave LED display.
	The generator is out of operation.	Replace the AirSave Control Box.
operation, although air flows to the AirSave Control Box.	The system cabling is damaged.	Repair the system cabling.
	The system cabling is defective.	Correct the system cabling.
Air escapes from the rotor.	The rotor is untight.	Replace the rotor.
The tyre pressure is too low.	The shut-off valve is closed.	Open the shut-off valve on the AirSave Control Box.
	The pressure setting at the system is too low.	Increase the system pressure at the AirSave Control Box.
The tyre pressure is too high.	The tyre was filled manually with too much pressure.	Reduce the tyre pressure.
	The pressure setting on the system is too high.	Reduce the system pressure at the AirSave Control Box and reduce the tyre pressure.
The semi-trailer or drawbar trailer deflate when at standstill.	The system tube or the tube/tyre valve connection is untight.	Correctly tighten the connection, replace the seals or replace the tyre valve.
	The tube valve is untight.	Clean or replace the valve.
	The tyre is untight.	Repair the tyre.
The tyre fills only slowly or no air flows to the tyre.	The valve hose to the tyre may be tightened too tightly, causing a blockage in the air flow.	Correctly tighten the connection or replace the tube or seal if it is damaged.

Page 42 BPW-EA-AS 37882401e

# 9 Fault diagnostics

Condition	Possible causes	Measures
Control Box is not functioning	Inlet pressure < 6.0 bar	Check the inlet pressure and adjust if necessary
	major tyre leakage that AirSave can no longer compensate for	Repair the tyre
	> a garage/service station must be consulted immediately	
The LED display is permanently lit	outer damage to the rotor or hub cap adapter> a garage/service station must be consulted immediately	Replace the defective rotor or hub cap To ensure that the system does not pump incessantly, despite there not being a tyre leak, AirSave can be swit- ched off until repairs are carried out. The ball valve on the ControlBox must be closed for this purpose

AirSave warranty conditions	
Axles with RV / RX code	10.1
Axles with R1 / RT / RY code	10.2
Redrilled axles with a BPW-approved drilling device	
Explanation of AirSave axle identification marks	

AirSave and all components that are fitted to the axle have a 2-year warranty. BPW axles are subject to the current ECO Plus Warranty Conditions.

#### 10.1 For axles with RV / RX code:

The BPW AirSave System must only be used in combination with axles prepared by BPW. For damages that occur as a result of any other combination, no claims from the BPW ECO Plus Warranty may be made. The AirSave System must be installed before the initial commissioning of the vehicle. Continuous operation of an axle prepared by BPW without an installed BPW AirSave System can lead to damage to the BPW scope of supply. If no BPW AirSave System is used, the BPW axle with RV / RX code must be restored to a safe operating condition (removal of the tubing and assembly of the plugs in the axle beam and axle stub, including replacement of the hub cap).

#### 10.2 For axles with R1 / RT / RY code:

The BPW AirSave System must only be used in combination with axles prepared by BPW. For damages that occur as a result of any other combination, no claims from the BPW ECO Plus Warranty may be made. The AirSave System must be installed before the initial commissioning of the vehicle. Continuous operation of an axle prepared by BPW without an installed BPW AirSave System can lead to damage to the BPW scope of supply. In this case, the steering knuckle plug must be checked every 3 years to ensure a tight seat, and must be replaced if necessary.

#### 10.3 In the case of redrilled axles with a BPW-approved drilling device:

Retrofitting axles to the BPW AirSave system is only permitted using a BPW-certified drilling device. For damages that occur as a result of any other kind of retrofitting, no claims can be made under the BPW ECO Plus Warranty. Operation without prior installation of AirSave components/parts can lead to damage to the BPW scope of supply.

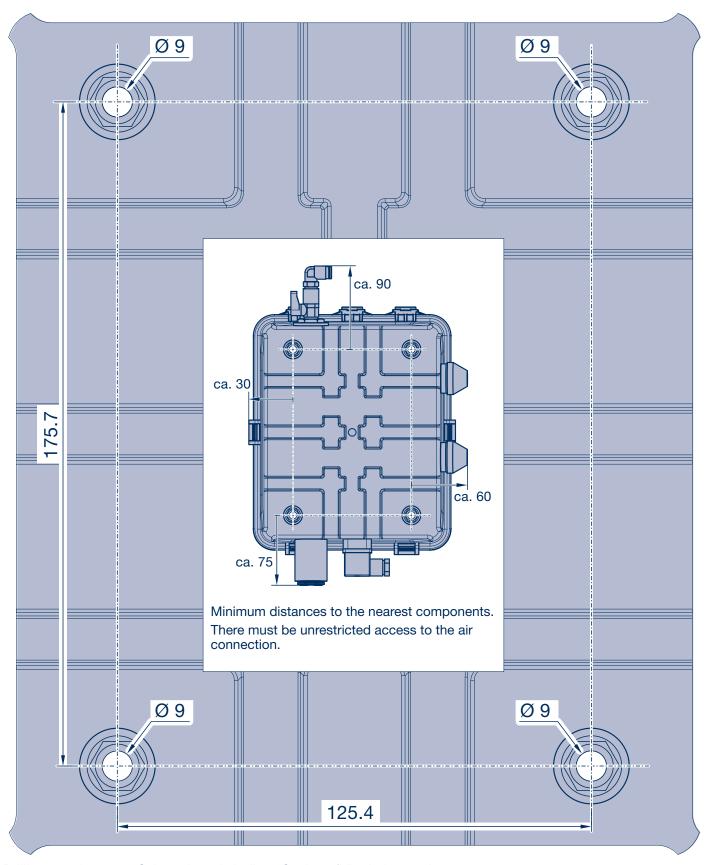

## 10.4 Explanation of AirSave axle identification marks:

- RV Square tube axle
- RX Round tubeless axle
- R1 Square axle for AirSave preparation only
- RT Square axle for AirSave/TireBoss preparation only
- RY Round axle for AirSave preparation only

BPW is a globally leading manufacturer of intelligent running gear systems for trailers and semi-trailers. As an international mobility and system partner, we offer a wide range of solutions for the transport industry from a single source, from axle to suspension and brake to user-friendly telematics applications.

We thereby ensure outstanding transparency in loading and transport processes and facilitate efficient fleet management. Today, the well-established brand represents an international corporation with a wide product and service portfolio for the commercial vehicle industry. Offering running gear systems, telematics, lighting systems, composite solutions and trailer superstructures, BPW is the right system partner for automotive manufacturers.

BPW, the owner-operated company, consistently pursues one target: To always give you exactly the solution which will pay off. To this end, we focus our attention on uncompromising quality for high reliability and service life, weight and time-saving concepts for low operating and maintenance costs as well as personal customer service and a close-knit service network for quick and direct support. You can be sure that with your international mobility partner BPW, you always use the most efficient method.

# Your partner on the path to economic viability
