Air bags are an important part of the overall running gear system. Using compressed air, they support the weight of a vehicle.

Their main role is to ensure a consistent ride height and the comfort that this provides.

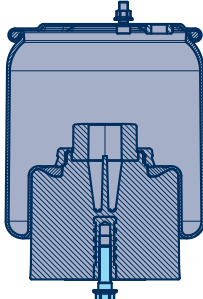

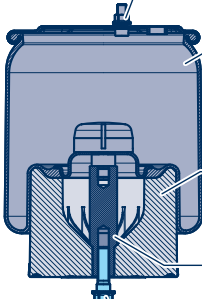

Investing in high-quality BPW Original air bags can improve the performance, durability and cost efficiency of a vehicle over its entire life expectancy.

This means that BPW air bags are important components because they directly impact the ride quality and handling of a vehicle.

BPW focused on the points above when further developing the product, coming to the conclusion that the centrally bolted type 30/30 K air bag products must be replaced in order to ensure the long-term quality of the product and to provide sustainable running gear solutions. The air bags will also now be repairable again because the air spring piston and bag can be replaced separately.

Type	Previous item number	New item number
30 K	05.429.43.91.0	05.429.44.02.0
30 K*	05.429.43.96.0	05.429.44.03.0
30	05.429.43.90.0	05.429.44.04.0

* With integrated air connection in the stud bolt of the upper air bag attachment
