Every action must be exactly right when servicing and repairing brakes.

The new case is much more compact and presents the new tool kit, developed by BPW and HAZET engineers, in a two-colour soft foam insert.

This doesn't just look attractive, it is also practical: the individual part numbers are embossed both on the tools and on the soft foam insert. This means you can see immediately if something is missing – and you can reorder precisely the right item.

The new digital functions are typical of BPW:

the QR code on the case opens the digital instruction manual on the smartphone, the parts catalogue and, in future, even videos that provide a practical explanation of optimum handling.

The tools developed by BPW and HAZET and manufactured from highly tempered tool steel are of an even higher quality than before. And even smarter: a completely redesigned compact impact wrench replaces four previous tools – and what is not there cannot go missing in everyday workshop life.

The impact wrench makes loosening and tightening the brake considerably easier. For the first time, torque-controlled tightening of brake calliper screw connections is possible with a classic torque wrench.

The new trapezoidal threaded spindle now has a pre-assembled axial bearing that is firmly connected to the spindle – this means that the force is transferred perfectly to the tools when working on the brake.

Another new feature is the adaptable pressing tool, which securely fixes the bellow for the first time with or without the brake disc being installed.

Result: increased safety and efficiency with every action.
