

Change of the coating at BPW drum-brake cylinders

From week 34 the BPW spring-break cylinders (diaphragm cylinders for drum-brakes) will be delivered with an optimized coating at the spring-break part.

Outer recognition feature is the color (black, RAL 9005), the powder-coating has the advantage of an optimized corrosion resistance, even in the field of flanging. A mixed installation is possible, because of the unchanged technical functionality of the cylinders.

New coating of the spring brake part -> black

Current coating of the spring brake part -> silver
