

Improvements for BPW disc brake cylinders

In week 8 the production of the BPW membrane-membrane spring brake cylinders for disc brakes is changed over to an optimized coating at the spring brake part and to a flanged strap at the operational brake part. It affects the types 14/24", 15/24" and 16/24".

Outer recognition feature is the color (black, RAL 9005), the coating has the advantage of an optimized corrosion resistance, even in the field of flanging.

The conversion of the clamped strap improves the quality of the seal of the operational braking part.
