

## New ventilation system of the brake disc for 22.5" tyres

In June 2016 BPW will introduce an optimized design of the brake disc for 22.5" tyres (for the brakes TSB 4309 und TSB 4312).

The new 22.5" brake disc has the following advantages:

- › The special "Y-shape" and arrangement of the pillars improves the heat crack resistance.
- › The offset venting channel provides a better ventilation of the disc and therefore low operating temperatures and a reduced wear.
- › The friction rings of the brake disc have a different thickness while maintaining the same wear volume. The increased mass on the flange side increases the heat absorption capacity and the resistance against heat cracks is improved.

The change of the brake disc takes place within the existing part number and has no influence on existing approvals.

The discs are interchangeable and a mixed fitting of an old and new brake disc on one axle is possible.

The new discs will also be gradually introduced in the aftermarket while retaining the known part numbers.
