BPW-EL-W 31261601e

we think transport

BPW-EL-W 31261601e

BPW is a globally leading manufacturer of intelligent running gear systems for trailers and semi-trailers. As an international mobility and system partner, we offer a wide range of solutions for the transport industry from a single source, from axle to suspension and brake to user-friendly telematics applications.

We thereby ensure outstanding transparency in loading and transport processes and facilitate efficient fleet management. Today, the well-established brand represents an international corporation with a wide product and service portfolio for the commercial vehicle industry. Offering running gear systems, telematics, lighting systems, composite solutions and trailer superstructures, BPW is the right system partner for automotive manufacturers.

BPW, the owner-operated company, consistently pursues one target: To always give you exactly the solution which will pay off. To this end, we focus our attention on uncompromising quality for high reliability and service life, weight and time-saving concepts for low operating and maintenance costs as well as personal customer service and a close-knit service network for quick and direct support. You can be sure that with your international mobility partner BPW, you always use the most efficient method.

Your partner on the path to economic viability

BPW Type designations	Example:
The BPW type name is composed of a letter group and a number group.	HSF 9010 ECO-P
The letter group identifies the type of axle and suspension version as well as defining the hub version.	HSF - BPW axle series H for single wheels (without offset), wheel studs M 22 x 1.5, without wheel nuts
The number group specifies the axle load on the ground in kilogrammes and the number of wheel studs per wheel hub (for disc wheel connection).	9010 - 9000 kg axle load - 10 wheel studs per wheel
The group of letters at the end of the model name defines the type of hub bearing.	ECO-P - ECO^{Plus} bearing generation
You can view the brake certificate referenced by certificate type/test report number on the type plate by logging onto the BPW website at www.bpw.de (Download Centre in the German version of the website - „Bremsgutachten“).	e.g. S 90/.../TDB 00 07 - S 90 Certificate type - TDB 00 07 Test report no.

The BPW axle code number is shown on the type plate.

If this is missing or no longer legible, the BPW axle number can be read off the front end of the axle stub in most cases.

In steering axles and ECO Plus 2 bearings, there is no code number embossed on the front end of the stub.

From June 2012, the axle beam welding number will now be stamped onto the axle stub on the front.

Where the axle beam welding number is indicated, the axle can also be identified. See also BPW Internet application for spare part lists for commercial vehicles.

Mechanical suspensions series W

General

BPW W-units for tropical and arctic off-road applications.

For transporting robust goods on roads, off-road and on construction sites.

W-units designed by BPW for tandem axles are extremely well suited to use under even the harshest conditions.

Whether on or off-road, on construction sites, in the arctic or in the tropics – these robust and long-lasting multiple leaf spring suspension systems ensure reliable goods transport.

They operate purely mechanically. For example, they can easily be repaired even if the infrastructure is underdeveloped.

Description

BPW W-unit with low mounting brackets

- ⊙ For axle loads from 2 x 8t to 2 x 20t
- ⊙ Delivered as ready-to-fit, completely assembled unit
- ⊙ Proven for many years in harsh off-road and tipper applications
- ⊙ Constructed with a high level of lateral stability
- ⊙ Equipped with robust and long-life multi-leaf springs
- ⊙ Very long axle load equalization distances
- ⊙ Not sensitive to semitrailer tilt
- ⊙ Insensitive to heat, cold and dirt
- ⊙ High-quality mounting of the trunnion axle in bronze / composite bearing material bushes
- ⊙ Simple installation to the vehicle frame using bolt connection

Mechanical suspensions series W

General

Function

Whenever you need the ruggedness to cope with high axle loads under difficult operating conditions, choose leaf-sprung tandem axle units with an intermediate pivoting trunnion axle for holding the frame connecting pieces.

The spring packs are extremely sturdy and comprise several spring steel layers. They are mounted in swinging bearings on the trunnion axle using bronze / composite bearing material bushes. The axles are clamped onto the spring ends and are controlled by the offset main spring layers.

An even distribution of tension across the length of the spring is achieved thanks to the use of spring layers with different lengths. This produces a trapezoidal shape in the side view, which explains why the arrangement is also referred to as a trapezoidal spring. Two low supports between the springs are used for attachment below the vehicle, or a tall central block provides for direct mounting on the vehicle frame.

W

Description

BPW W-unit with tall bearing blocks

- ⦿ For axle loads from 2 x 8t to 2 x 20t
- ⦿ Delivered as ready-to-fit, completely assembled unit
- ⦿ Proven for many years in harsh off-road and tipper applications
- ⦿ Constructed with a high level of lateral stability
- ⦿ Equipped with robust and long-life multi-leaf springs
- ⦿ Very long axle load equalization distances
- ⦿ Not sensitive to semitrailer tilt
- ⦿ Insensitive to heat, cold and dirt
- ⦿ High-quality mounting of the trunnion axle in bronze / composite bearing material bushes
- ⦿ Simple installation to the vehicle frame using bolt connection

1 Leaf springs for suspensions series W

1.1 General

BPW W-units are equipped with multi-leaf springs.

Multi-leaf springs (trapezoidal springs) contain a stack of spring layers with different cross-sections and graded lengths to give a trapezoidal shape.

They are characterised by their robustness and good default driving properties as well as the ease of replacing individual spring layers.

The spring ends of the leaf springs are connected to the axles with spring U-bolts.

As a load-bearing component of the suspension unit, the leaf spring requires particular attention.

The following instructions should be carefully adhered to during repair and maintenance work:

- ⦿ Do not work on leaf springs with a hammer or any sharp objects.
- ⦿ Do not work on leaf springs with cutters or grinders.
In the event that replacement springs or leaves do not fit exactly into the seat of the spring pads or spring housing, the mounting seat must always be widened.
- ⦿ Individual leaves can be replaced in multi-leaf springs.

Important for all welding work!

The leaf springs, plastic pipings and other sensitive parts should be protected against sparks and weld splashes during all welding work.

The earth terminal must under no circumstances be attached to the leaf spring or hub.

Leaf springs for suspensions series W 1

General 1.1

BPW Code number

The BPW code number of the leaf spring is stamped into the spring shackle.

Leaf springs with safety catch

With a catch device, the lowest layer of the leaf springs is rolled in at the ends and is connected at the axle connection using shackles and bolts as well as an additional spring clamp.

Further information, along with installation and safety instructions, can be found in our current workshop manuals.

W

2 Axle clampings

2.1 General

Axle – leaf spring connection

The axle is connected to the leaf spring using the axle connection comprising: spring U-bolts, spring housing, spring cushions, spring pads, etc..

The (rubber) spring cushion inserted in the spring housing prevents vibration and helps to cushion shocks.

The bent-over spring ends are located in the recess in the plates (item 1040) arranged on the spring pads. In many leaf springs, these plates are riveted onto the lowest spring layer.

Axle alignment

After repairs have been carried out on the axle beam, connecting piece, connecting rods etc., the axle alignment must be checked and if necessary corrected.

Determine the diagonal dimensions **A - B** and **A - C** for the centre axle (reference axle) by means of comparative measurements (± 2 mm tolerance).

Check and if necessary correct the wheel base dimensions **B - D** and **C - E** for the rear axle (max. tolerance ± 2 mm).

In case of deviations, the parallel arrangement of the axles must be achieved by welding on the upper spring pads.

Measurement is generally carried out by means of the hub cap centre point (see illustration) or the centring hole in the axle stub.

It can also be carried out using screwed-on graduated tubes.

Hub cap centre point in the BPW logo.

The triangle (Δ) in the BPW logo is positioned centrally if there is an $\text{\textcircled{R}}$ or ECO (ECO^{Plus}) stamped below the BPW logo (since 1989/1994).

Axle clampings 2

General 2.1

Welding guidelines for axle beams

When fitting or repairing trailer axles it may be necessary to weld components onto the axle beam.

For that reason BPW axles are made of materials that can be welded. The axle beams do not have to be pre-heated before welding.

The carrying capacity and faultless operation of BPW axles are not impaired by welding, if the following points are complied with.

Welding process

- ⊙ Inert gas-shielded arc welding
Welding wire quality G 42 0 (DIN EN 440)
- ⊙ Manual arc welding
Stick electrodes E 42 2 (DIN EN 499)

Mechanical quality values must correspond to the basic material S 355 J 2 or S 420.

Max. weld thickness a 5 Δ (DIN EN 25817)

Avoid end craters and undercuts.

Miscellaneous

No unauthorised change to the camber angle of the axle.
Adherence to the welding zones and weld lengths as shown in the adjacent sketch.

👉 **No welding must be carried out in the lower tensile zone of the axle beam!**

👉 **Important for all welding work!**

The leaf springs, plastic pipings and other sensitive parts should be protected against sparks and weld splashes during all welding work.

The earth terminal must under no circumstances be attached to the leaf spring or hub.

3 Trunnion axle, trunnion axle bearings

3.1 General

Trunnion axle beam

The trunnion axle consists of a thick-walled tube to which are attached two low supports for attachment below the vehicle, or a tall central block between the springs provides for direct mounting to the vehicle frame.

Trunnion axle – leaf spring connection

The leaf spring axle is connected to the trunnion axle beam using the trunnion axle connection comprising: spring U-bolts, mounting brackets, spring plates, etc..

The generously sized bronze / composite bearing material bushes in the mounting brackets ensure a low-maintenance, long-lasting mounting.

Grease nipples attached to the mounting brackets permit straightforward greasing of the bearing points.

Trunnion axle, trunnion axle bearings 3

General 3.1

Trunnion axle bearing

The axle support bearing consists of bronze / composite bearing material bushes equipped with lubrication holes and ducts.

A sealing ring on the side facing the middle of the vehicle prevents dirt and dust from penetrating.

On the side facing the outside of the vehicle, a screwed-in hub cap prevents foreign bodies from penetrating.

If necessary, the closing rings and bronze / composite bearing material bushes can be changed in a straightforward procedure.

The slotted nuts bolted onto the ends of the trunnion axle beam are secured with hooked spring rings and pins to prevent them coming loose.

Mechanical suspensions series BW / GW

General

BPW BW and GW-units for medium-duty off-road applications.

For transporting robust goods on roads, off-road and on construction sites.

BPW BW and GW-units designed by BPW for tandem axles are extremely well suited to use under medium-duty conditions.

Whether on-road, off-road or on construction sites – these robust and long-lasting multiple leaf spring suspension systems ensure reliable goods transport.

They operate purely mechanically. For example, they can easily be repaired even if the infrastructure is underdeveloped.

Description

BPW BW-unit (with bronze bushes)

- ⦿ For axle loads from 2 x 8t to 2 x 12t
- ⦿ Delivered as ready-to-fit, completely assembled unit
- ⦿ Proven for many years in harsh off-road and tipper applications
- ⦿ Constructed with a high level of lateral stability
- ⦿ Equipped with robust and long-life multi-leaf springs
- ⦿ Very long axle load equalization distances
- ⦿ Not sensitive to semitrailer tilt
- ⦿ Insensitive to heat, cold and dirt
- ⦿ High-quality mounting of the trunnion axle in bronze bushes
- ⦿ Simple installation to the vehicle frame using bolt connection

Mechanical suspensions series BW / GW

General

Function

Whenever you need to cope with high axle loads under difficult operating conditions, choose leaf-sprung tandem axle units with an intermediate pivoting trunnion axle for holding the frame connecting pieces.

The spring packs are extremely sturdy and comprise several spring steel layers. They are mounted in swinging bearings on the trunnion axle using bronze or rubber bushes. The axles are clamped onto the spring ends and are controlled by the main spring layers.

An even distribution of tension across the length of the spring is achieved thanks to the use of spring layers with different lengths. This produces a trapezoidal shape in the side view, which explains why the arrangement is also referred to as a trapezoidal spring. Two tall blocks for direct mounting on the vehicle frame are used for attachment under the vehicle.

**BW
GW**

Description

BPW GW-unit (with rubber bushes)

- ⦿ For axle loads from 2 x 8t to 2 x 10t
- ⦿ Delivered as ready-to-fit, completely assembled unit
- ⦿ Proven for many years in off-road and tipper applications
- ⦿ Constructed with a high level of lateral stability
- ⦿ Equipped with robust and long-life multi-leaf springs
- ⦿ Very long axle load equalization distances
- ⦿ Not sensitive to semitrailer tilt
- ⦿ Insensitive to heat, cold and dirt
- ⦿ Low-maintenance mounting of the trunnion axle in rubber bushes
- ⦿ Simple installation to the vehicle frame using bolt connection

4 Leaf springs for suspensions series BW / GW

4.1 General

BPW BW and GW-units are equipped with multi-leaf springs.

Multi-leaf springs (trapezoidal springs) contain a stack of spring layers with different crosssections and graded lengths to give a trapezoidal shape.

They are characterised by their robustness and good default driving properties as well as the ease of replacing individual spring layers.

The spring ends of the leaf springs are connected to the axles with spring U-bolts.

The pins of the upper spring pads project into the two lower, drilled spring layers.

In many leaf springs, plates are riveted onto the lower spring layers.

Leaf springs for suspensions series BW / GW 4

General 4.1

BPW Code number

The BPW code number of the leaf spring is stamped into the spring shackle.

BW
GW

As a load-bearing component of the suspension unit, the leaf spring requires particular attention.

The following instructions should be carefully adhered to during repair and maintenance work:

- ⦿ Do not work on leaf springs with a hammer or any sharp objects.
- ⦿ Do not work on leaf springs with cutters or grinders.
In the event that replacement springs or leaves do not fit exactly into the seat of the spring pads or spring housing, the mounting seat must always be widened.
- ⦿ Individual leaves can be replaced in multi-leaf springs.

Important for all welding work!

The leaf springs, plastic pipings and other sensitive parts should be protected against sparks and weld splashes during all welding work.

The earth terminal must under no circumstances be attached to the leaf spring or hub.

Further information, along with installation and safety instructions, can be found in our current workshop manuals.

5 Axle clampings

5.1 General

Axle – leaf spring connection

The axle is connected to the leaf spring using the axle connection comprising: spring U-bolts, spring housing, spring pads, etc..

The (rubber) plate inserted in the spring housing prevents vibration and helps to cushion shocks.

A pin on the top spring pad projects into the two lower drilled spring layers and ensures a secure axle connection.

Axle alignment

After repairs have been carried out on the axle beam, trunnion axle, etc., the axle alignment must be checked and if necessary corrected.

Determine the diagonal dimensions **A - B** and **A - C** for the centre axle (reference axle) by means of comparative measurements (± 2 mm tolerance).

Check and if necessary correct the wheel base dimensions **B - D** and **C - E** for the rear axle (max. tolerance ± 2 mm).

In case of deviations, the parallel arrangement of the axles must be achieved by aligning and then welding the pin plates (no. 1028) onto the upper spring pads.

Measurement is generally carried out by means of the hub cap centre point (see illustration) or the centring hole in the axle stub.

It can also be carried out using screwed-on graduated tubes.

Hub cap centre point in the BPW logo.

The triangle (Δ) in the BPW logo is positioned centrally if there is an ® or ECO (ECO^{Plus}) stamped below the BPW logo (since 1989/1994).

Axle clampings 5

General 5.1

Welding guidelines for axle beams

When fitting or repairing trailer axles it may be necessary to weld components onto the axle beam.

For that reason BPW axles are made of materials that can be welded. The axle beams do not have to be pre-heated before welding.

The carrying capacity and faultless operation of BPW axles are not impaired by welding, if the following points are complied with.

Welding process

- ⊙ Inert gas-shielded arc welding
Welding wire quality G 42 0 (DIN EN 440)
- ⊙ Manual arc welding
Stick electrodes E 42 2 (DIN EN 499)

Mechanical quality values must correspond to the basic material S 355 J 2 or S 420

Max. weld thickness a 5 Δ (DIN EN 25817)

Avoid end craters and undercuts.

Miscellaneous

No unauthorised change to the camber angle of the axle.
Adherence to the welding zones and weld lengths as shown in the adjacent sketch.

👉 **No welding must be carried out in the lower tensile zone of the axle beam!**

👉 **Important for all welding work!**

The leaf springs, plastic pipings and other sensitive parts should be protected against sparks and weld splashes during all welding work.

The earth terminal must under no circumstances be attached to the leaf spring or hub.

6 Trunnion axle, trunnion axle bearings

6.1 General

Trunnion axle beam

The trunnion axle consists of a thick-walled tube (or solid round stock if necessary) with two high mounting brackets bolted onto it using clamping brackets for attachment under the vehicle.

The leaf springs are enclosed by the bearing block in a U-shaped arrangement.

Trunnion axle – leaf spring connection

The leaf spring axle is connected to the trunnion axle beam using the trunnion axle connection comprising: spring U-bolts, spring housing, mounting brackets, etc..

The generously sized bronze bushes in the mounting brackets of **BW-units** ensure a low-maintenance, long-lasting mounting.

Grease nipples attached to the mounting brackets permit straightforward greasing of the bearing points on **BW-units**.

In **GW-units**, the bearing block is split and long-life rubber bushes permit an almost maintenance-free bearing to be achieved.

7 Lubrication and maintenance work

W
BW
GW

Lubrication and maintenance work (Overview)

Overview		initially after 2 weeks	every 6 weeks	alle 26 Wochen (halbjährlich) ¹⁾
<input type="radio"/>	Lubricate			
<input type="checkbox"/>	Maintenance work			
①	Greasing the trunnion axle (Not required with rubber bushes). Raise the vehicle to take the weight off the bearing points.	⊙ ¹⁾	⊙ ¹⁾	
②	Grease the spring housing. (Grease for the first time when the vehicle is taken into service!)	⊙ ¹⁾	⊙ ¹⁾	
-	Visual inspection Check all parts for damage and wear.			⊙ ¹⁾
①	Use a torque wrench to check the spring U-bolts on the trunnion axle are firmly tightened. M 30 x 2-8.8 M = 980 Nm M 36-8.8 M = 1555 Nm	⊙ ¹⁾		⊙ ¹⁾
②	Check that the mounting bolts on the bearing cups are firmly tightened. M 20-8.8 M = 320 Nm M 24-8.8 M = 570 Nm			⊙ ¹⁾
③	Use a torque wrench to check the spring U-bolts on the spring housings are firmly tightened. M 20-8.8 M = 320 Nm M 20-10.9 M = 450 Nm M 24-8.8 M = 570 Nm M 24-10.9 M = 700 Nm	⊙ ¹⁾		⊙ ¹⁾

¹⁾ under extreme conditions, with more frequency.

Further information, along with installation and safety instructions, can be found in our current workshop manuals.
